Analyzing the Gig Economy

By David Nwoye

Date: 21.03.2026

Introduction

The Gig economy has led to the transformation of the modern-day labor market, enabling flexible, short-term, and freelance jobs on various digital platforms. This project presents a comprehensive analysis of key factors such as success rate, freelancer earnings, and market trends and their influence on decision-making in the gig ecosystem. The goal is to assist businesses, freelancers and policymakers to make data-driven decisions.

Problem Statement

Over the years, the gig economy has shown continuous rapid growth, with freelancers and businesses searching for ways to minimize costs and maximize their profits on various platforms. Such situations often create challenges for the clients and freelancers, whereby they are unable to accurately forecast earnings, job success rate, and skills demand. Hence, it is essential to provide data-driven insights to predict earnings and job trends in order to properly guide both parties and make informed decisions.

Data Cleaning & preprocessing

- We were provided with two Excel tables
  - Freelancer earnings
  - Freelancer details

- We checked the data for duplicates and errors, but non-existent.

- Ensured that each column has the right data type.

- Used inner-join to connect both data in Tableau with their common key Freelance ID.

KPIs

Total earnings

$9.8M

Total Net income

$9.3M

Avg. earnings

$5.02K

Total Marketing spend

$484.6K

KPIs

Total jobs completed
294,185

Avg. Success rate
74.95%

Avg. Rehire rate
44.6%

Avg. jobs completed
151

Avg. Client Rating
4.0

Freelancer earnings prediction

Multiple linear regression to predict earnings with all variables

P < 0.05 is significant
P > 0.05 not significant

Variables	p-value	Significant
Jobs completed	0.412	no
Hourly rate	0.505	no
Job success rate	0.184	no
Client rating	0.402	no
Job duration days	0.680	no
Rehire rate	0.073	marginal but not < 0.05
Marketing spend	**0.045**	**yes**

Marketing spend can be used to predict earnings
Coefficient = 0.90

Linear regression to predict earnings with marketing spend

Variable	p-value	Significant
Marketing spend	0.057	slightly > 0.05

Intercept = 4806.19
Coefficient = 0.85

To predict earnings we apply the equation of a straight line using average marketing spend of $249

Y = mx t c
where y = earnings, c = 4806.19, m = 0.85, x = 249

Earnings = (0.85 x 249) + 4806.19 = $5017.8

We can say the average predicted earnings of a freelancer who spends an average of $249 to secure a gig is about $5017.8

This corresponds to the average earnings that is shown in our KPI card in slide 4: $5.02K

Dashboard & Reporting

Freelancer Analytics Dashboard

Recommendations

Stakeholders should:

- Expand talent acquisition and client engagement in Upwork and Fiverr.
  - High performing platforms
  - High job activity
- Invest in skill development for web and app development in Australia and the Middle East.
  - To maximize market growth
- Invest in app development, customer support, and graphic design.
  - High demand and high earning job categories
- Improve freelancer performance metrics.
